

Field sampling & laboratory analysis

Measure volume of blood sample in capillary tube following venipuncture

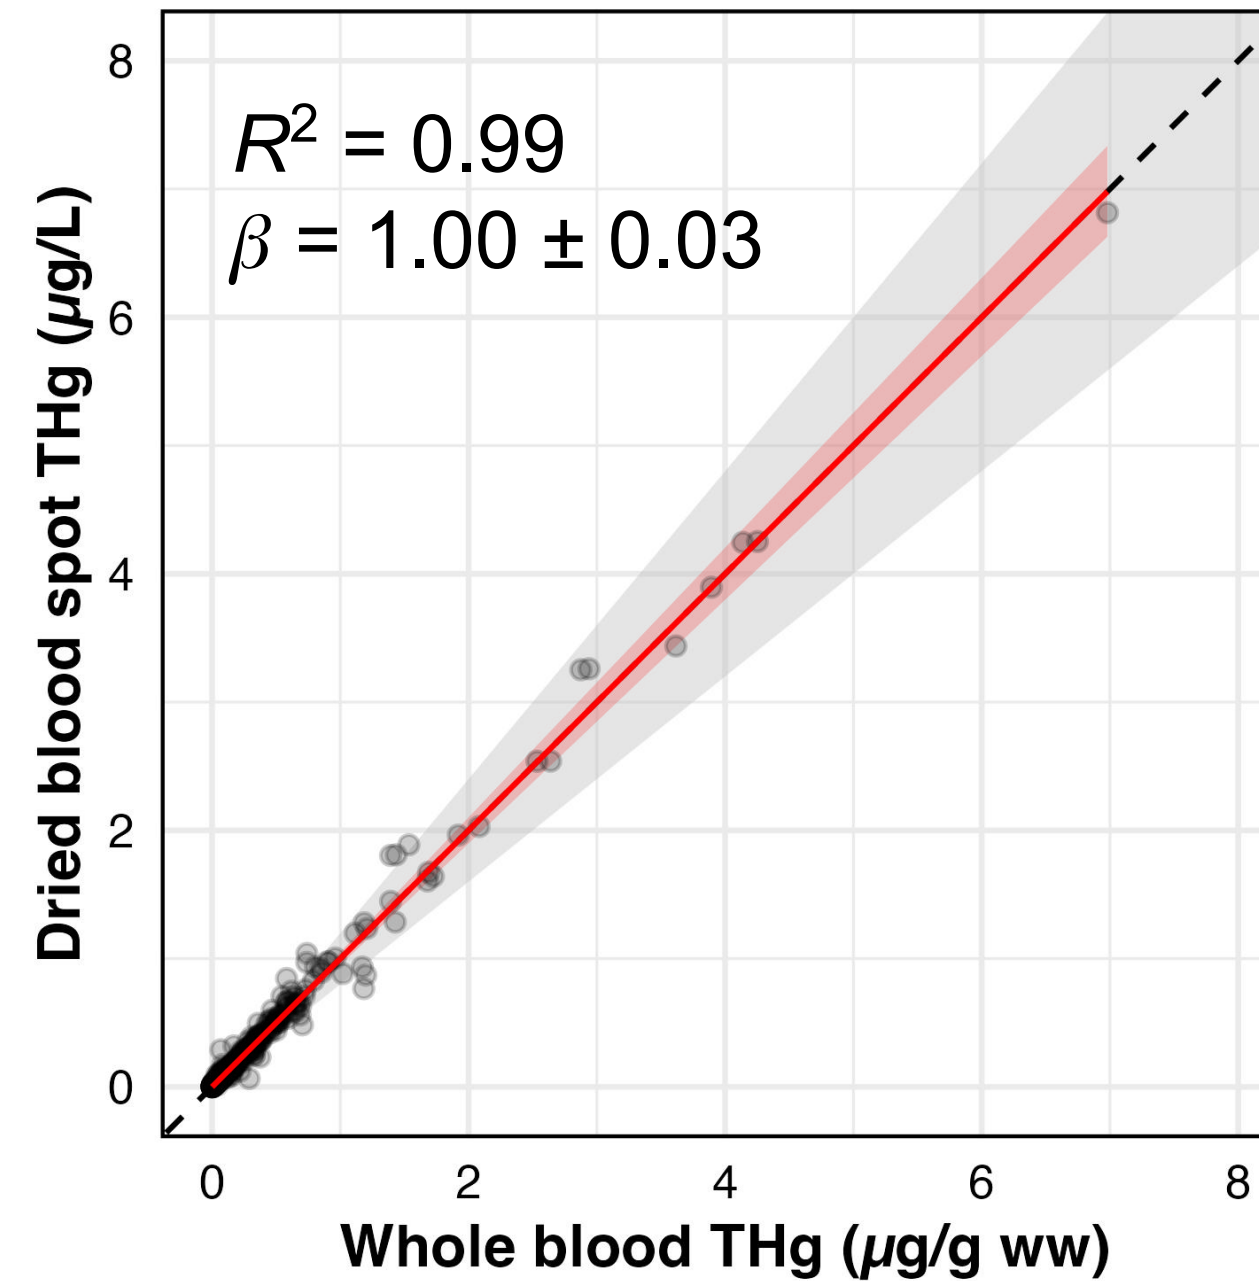

Length (mm) = Volume (μL)
50 mm = 50 μL

Draw dried blood spot onto filter paper card & extract for Hg analysis

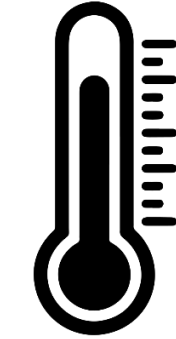

Validation

Bayesian error-in-variables linear regression of paired samples

Method takeaways

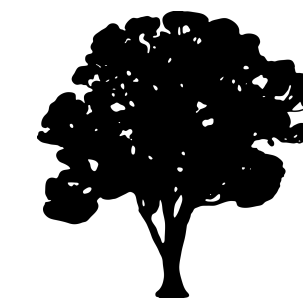

Can be stored at ambient temperatures

Less costly than whole blood sampling

Allows variably sized blood draws for animal welfare

Portable & reliable for remote field conditions
